

Test log 20.04.2017

Name	Steinar Andreassen Jensen
Place	Trondheim Spektrum
Distance/Time	200m
Ground	Pavement
Comments	<p>Steinar tested Pre-Alpha and now got to test Alpha. In general, he is not used to propelling with poles and sitting on his knees is unusual. After a little adjustment we found an ok seating position, but it did not get optimal. He could need to have his knees higher so that the seat could relieve more of the weight. He might want wider straps around the hip, like snowboard bindings. He was pleased that the slope was shorter than last, which improved the turning radius. He liked to have the trucks relatively loose. He suggested having the brakes on the side of the seat and liked the idea of hydraulic brakes. In general, he had a better impression than last time. He believes that there is basically no need for a motor since this is a training product Bendik: Steinar mastered the gap better than last time and he was positive. I think he likes us as a team very well and that it can prevent him from coming up with all the critical comments. In order for the tile to function optimally for Steinar, the seating unit must adapt more. This along with better spells I think will suffice for this to be something for Steinar</p>
